

# **Introduction to Bioinformatics**

## **Basic Genome Biology**

Stevan Radanović & Dejan Rilak Miloš Popović

# What is Bioinformatics

## Wikipedia:

**Bioinformatics** <sup>ˈ/ˌbaɪ.ɒʊˌɪnfərˈmætɪks/</sup> is an interdisciplinary field that develops methods and software tools for understanding biological data. As an interdisciplinary field of science, **bioinformatics** combines computer science, statistics, mathematics, and engineering to analyze and interpret biological data.

- Measurement theory
- Computer Science
- Engineering
- Biology

# Why Genome Biology?

- Understanding what is being measured
- Interpreting errors
- Interpreting results
- For fun

**The Central Dogma of Molecular Biology**

**DNA makes RNA makes Protein**

# Proteins

- Provide cell structure
- Do most of the cells work
- Made of 1D strings of amino acids connected by peptide bonds (polypeptides)
- Folded into 3D structure which enables useful function

# Amino Acids & Protein folding

## Nonpolar, aliphatic side groups

## Polar, uncharged side groups

## Aromatic side groups

## Positively charged side groups

## Negatively charged side groups

# Central Dogma

- Flow of genetic information within a biological system - DNA makes RNA, and RNA makes protein

# Central Dogma

- DNA (deoxyribonucleic acid) - double stranded molecule
- More stable, redundant information - complementary chain
- Nucleobases (T, A, C, G) encode for proteins

# Central Dogma

- RNA (ribonucleic acid) - single stranded molecule
- Less stable, no redundant information
- Nucleobases (U, A, C, G) encode for proteins

# Central Dogma

# Amino Acid Codons

# Genes and Alleles

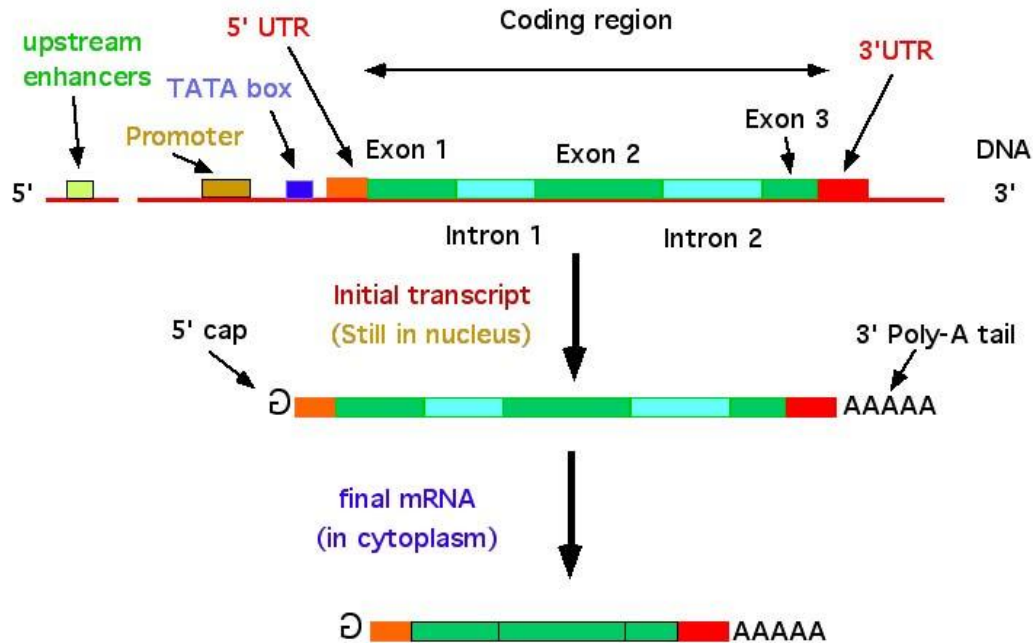

## Wikipedia on Gene:

A **gene** is a **locus** (or region) of **DNA** that encodes a functional **RNA** or **protein** product, and is the **molecular** unit of **heredity**.<sup>[1][2]</sup>Glossary The transmission of genes to an organism's **offspring** is the basis of the inheritance of **phenotypic traits**. Most biological traits are under the influence of **polygenes** (many different genes) as well as the **gene–environment interactions**. Some genetic traits are instantly visible, such as **eye colour** or number of limbs, and some are not, such as **blood type**, risk for specific diseases, or the thousands of basic **biochemical** processes that comprise **life**.

## Wikipedia on Allele:

An **allele** (UK **/ˈæliːl/** or US **/əˈliːl/**), or **allel**, is one of a number of alternative forms of the same **gene** or same **genetic locus**.<sup>[1][2]</sup> Sometimes, different alleles can result in different observable **phenotypic traits**, such as different **pigmentation**. However, most genetic variations result in little or no observable variation.
